Re: West Divide Creek 2011 Third Quarter Seep Status

Dear Mr. Jensen:

Rule Engineering (Rule) prepared this report to present the results of the quarterly monitoring, and review of historical data of all groundwater monitoring stations associated with the West Divide Creek Seep for Encana Oil and Gas (USA) Inc. Rule was contracted by Encana to continue monitoring and Operation and Maintenance (O&M) of the existing remediation system at West Divide Creek in July of 2011. This letter report provides a summary of results and recommendations for the gas seep associated with Colorado Oil and Gas Conservation Commission (COGCC) ORDER NO. 1V-276. Figure 1 provides a map of monitoring stations and remediation system locations for this site.

2011 Third Quarter Monitoring

Groundwater

During September 14 and 15, 2011 Rule sampled 19 groundwater monitoring wells as part of the quarterly monitoring program. Two monitoring wells (MW-23 and MW-27) and one domestic well (Eich2) were sampled by Olsson & Associates September 15, 2011. Two monitoring wells MW-15 and MW-19 were inaccessible due to vegetation growth. MW-19 is known to be plugged and will be abandoned if possible in the future, as it's location is within a marshy area. An effort will also be made to locate MW-15 during the fourth quarter sampling event when vegetation conditions are minimal. Prior to sample collection, static water levels were measured at the wells and piezometers to within 0.01 feet (ft) from the top of the north side of the PVC casing using an electronic water level meter. Depth to water (DTW) was measured in all available wells and piezometers at the site. Piezometers 5 and 8 were plugged by sediment therefore DTW was not measured. Prior to collection of the groundwater sample, each well was purged of three casing volumes of water using disposable bailers. Field parameters were obtained during sample collection which included pH, temperature, specific conductance, dissolved oxygen and oxygen reduction potential (ORP) with an YSI® water quality meter. The field measurement results are provided in Table 1.

A total of 3 duplicate samples were collected for field and laboratory quality assurance/quality control (QA/QC). Duplicate samples DUP-1-091511, DUP-2-091511 and DUP-3-091511 were collected at monitoring stations MW-17, MW-2 and MW-14 respectively.

All groundwater samples were immediately placed on ice after sample collection and shipped under Chain-of-custody procedures to Environmental Science Corporation (ESC) for laboratory analysis. Samples were received in good condition within appropriate temperatures by ESC and analyzed for the following parameters:

- Benzene, Toluene, Ethylbenzene, Total Xylene's (BTEX), Method-8260
- Methane, Ethane, Ethene, Method-RSK175
- Chloride, Method-9056
- Sodium, Method-6010B

Two samples (MW-2 and MW-4) were analyzed for additional parameters (Major cations and anions) that were requested by the COGCC for another project. The analytical reports (Appendix A) contain this data, but no discussion is provided in this report for the additional analysis. A summary of the groundwater analytical results is presented in Table 2 and 3.

In addition to the groundwater chemistry analysis provided by ECS, samples for isotopic methane (biogenic/thermogenic) analysis were shipped to Isotech Laboratories (Isotech). Monitoring wells MW-2, 4, 9, 14 and 17 were analyzed for isotopic methane. Samples were received in good condition within appropriate temperatures by Isotech and analyzed for stable isotopes of carbon and hydrogen in methane and stable isotopes of carbon in ethane and propane. A summary of the isotopic methane analytical results is presented in Table 4.

Surface-Water

Rule collected eight surface-water samples on September 14, 2011 at the established monitoring stations. Field parameters were obtained during sample collection which included pH, temperature, specific conductance, dissolved oxygen and ORP with an YSI® water quality meter. The surface water field measurements are provided in Table 5. All surface-water samples were immediately placed on ice after sample collection. Samples were received in good condition within appropriate temperatures by ESC and analyzed for the following parameters:

- BTEX, Method-8260
- Methane, Ethane, Ethene, Method-RSK175
- Chloride, Method-9056
- Sodium, Method-6010B

A summary of surface-water analytical results is presented in Table 6 and 7.

Remediation System

Prior to September 15, 2011 the system was running from 0100 hrs to 0900 hrs daily. All sparge wells were running, excluding AS-6 and AS-15, from previous operations. All operational air sparge wells were running between 4 and 6 standard cubic feet per minute (SCFM), and pressures ranging from 3 to 4.5 pounds per square inch (PSI). Blower 1 and Blower 2 were running at 40 SCFM. After September 15, the air sparging system was optimized to run from 1200 hrs to 1600 hrs daily and reduce the air flow to remediation wells AS-2, 8, 9, 10, 11 and 13, each operating at a flow rate of approximately 6 CFM with Blower 1 running at 55 CFM and Blower 2 turned off. These changes to the remediation system were made to increase operational efficiency of the blowers while continuing to maintain the level of oxygenation of the aquifer that can be achieved with the current configuration of the remediation wells.

Results

Site Hydrology

During the monitoring period of September 2011, groundwater elevation varied from surface at MW-25, with an elevation 5968 ft above mean sea level (AMSL), to 5936 ft at MW-23. Figure 2 illustrates the potentiometric surface for the site during this quarter. An average groundwater gradient was determined to be 0.025 with a groundwater flow to the northeast/north consistent with the drainage system of the West Divide Creek within the seep area.

Analytical Results

Groundwater analytical results indicate that monitoring stations MW-2, MW-4 and MW-17 had benzene concentrations of 0.13 mg/L, 0.057 mg/L and 0.064 mg/L respectively. Toluene and Ethylbenzene were below detection levels in all wells. Total xylenes were detected at MW-2 and MW-4 at concentrations of 0.035 mg/L, 0.02 mg/L respectively, which are below COGCC Table 910-1 standards. Figure 3 illustrates BTEX and methane results for the third quarter. Figure 4 illustrates the benzene impacts greater than 0.005 mg/l. The highest concentration of methane was observed in MW-2 and MW-4 with concentrations of 8.0 mg/L and 16.0 mg/L respectively. Figure 5 illustrates the methane concentrations above 1 mg/L. Isotopic analysis indicate all samples (MW-2, 4, 9, 14 and 17) are of thermogenic origin (Figure 6).

Observed methane concentrations range from non-detect to 16 mg/L. The highest concentration was observed within the seep area and is thermogenic in origin. Currently there is no methane or sodium standard with COGCC or Colorado Department of Public Health and Environment (CDPHE) Water Quality Control Commission Regulation NO. 41.

Figure 7 illustrates the combined sodium (Na) chloride (Cl) concentrations in groundwater. The highest NaCl concentration observed was in MW-23 with a concentration of 495 mg/L, which is downgradient of the seep area. The lowest concentration observed was in MW-25 with a concentration of 47.7 mg/L southeast of the seep. Some of the lowest concentrations were observed within the seep area (See Figure 7). Figure 7 illustrates the seep area has no correlation of sodium and chloride concentrations observed within the site. The largest concentrations observed are far downgradient of the seep area and can be attributed to natural groundwater geochemistry conditions.

Analytical results indicate that no organics were detected in the surface-water for the above mentioned analysis.

A summary table (Table 8) is presented to illustrate the relative percent difference (RPD) of the duplicate samples collected for QA/QC for this monitoring period. Two analytes, benzene and methane exceeded the 50% RPD standard for MW-2 and MW-4 respectively. With all other analytes being within the accepted RPD range for the duplicate samples, and an average variability of 25.11%, the reported results will be that of the higher reported value for the duplicate samples. The data is validated and a conservative approach will be used by reporting the higher of the two reported values.

Discussion of Historical Groundwater Monitoring Results

Since the start of the seep in 2004, Encana has collected 1,272 groundwater samples within the seep area. A summary of the historical BTEX and Methane concentrations is provided in the electronic attachment (Appendix B).

Monitoring stations 11, 13, 15, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27 Eich1/Eich2 and Lang have not had a detection of BTEX in 87 months. Encana continues to monitor these stations far past a point of compliance. Industry standard for petroleum contaminated sites for clean monitoring stations is 5 quarters. When the analytical results from continued groundwater monitoring show concentrations that are below the COGCC Groundwater Standards in Table 910-1 (or below laboratory detection levels) for 5 or more consecutive quarters, and given the understanding that the plume is not expanding further, monitoring at these locations should be reviewed. Monitoring using a smaller set of sampling locations downgradient of the source area should be sufficient.

Monitoring stations MW-2, MW-4 and MW-17 continue to illustrate that the source (Hydrocarbons) is present. Below is a summary of monitoring stations impacted by the seep.

At monitoring station MW-14, benzene concentrations declined dramatically before the system was installed in 2005 (Figure 8). Benzene concentrations have remained below the groundwater standard since March 2007. MW-14 was considered to be at the initial source area and is not within the treatment area.

Before the system was installed, MW-9 benzene concentrations declined to non-detect levels (Figure 9). MW-9 is not within the treatment area and benzene concentrations/source area have declined to non-detect.

MW-4 benzene concentrations remain above the groundwater standard, but continue to decline (Figure 10).

MW-2 benzene concentrations continue to be above the groundwater standard (Figure 11). MW-2 is not within the treatment area and benzene concentrations/source area have declined.

MW-1 benzene concentrations declined to non-detect levels before the system was installed (Figure 12). MW-1 benzene values have remained below groundwater standard since March 2005.

MW-17 benzene concentrations declined before the system start up, but have remained above the groundwater standard, and continue to decline (Figure 13).

MW-7 benzene concentrations declined to non-detect levels before the system was installed (Figure 14). MW-7 benzene concentrations have remained below groundwater standard since April 2005.

MW-8-benzene concentrations declined to non-detect levels before the system was installed (Figure 15). MW-8 benzene concentrations have remained below groundwater standard since July 2005.

Mr. Charlie Jensen
WDC 3rd Quarter Status Report
December 6, 2011
Page 5 of 5

MW-6 has shown no impacts since April 2005 (1 hit above the groundwater standard, prior to April 2005).

MW-12 has been clean since September 2007.

MW-16 has been clean since March 2006.

Divide Creek Remediation Analysis

The overall decline in benzene concentrations are attributed to a reduction in the mass flux of hydrocarbons from the seep. The natural processes of dilution, degradation, dispersion, and volatilization under the current site conditions provide remediation through natural attenuation (RNA), that has resulted in the observed concentration declines. Based on the extensive monitoring conducted to date, the groundwater plume is stable and will not migrate further to impact potential groundwater receptors at the water wells located downgradient.

Historical and current data indicate the treatment system has minimal or no effect on the current source area. Monitoring of dissolved oxygen indicates that the treatment system has limited effect on the source area. The background dissolved oxygen concentrations comparative to the treatment area concentrations are only increased by 16% within the treatment area for September 2011 (MW-25, Background vs. MW-8, Treatment Area).

Rule Engineering appreciates the opportunity to provide services to Encana. If you have any questions please contact me at 970-244-8500.

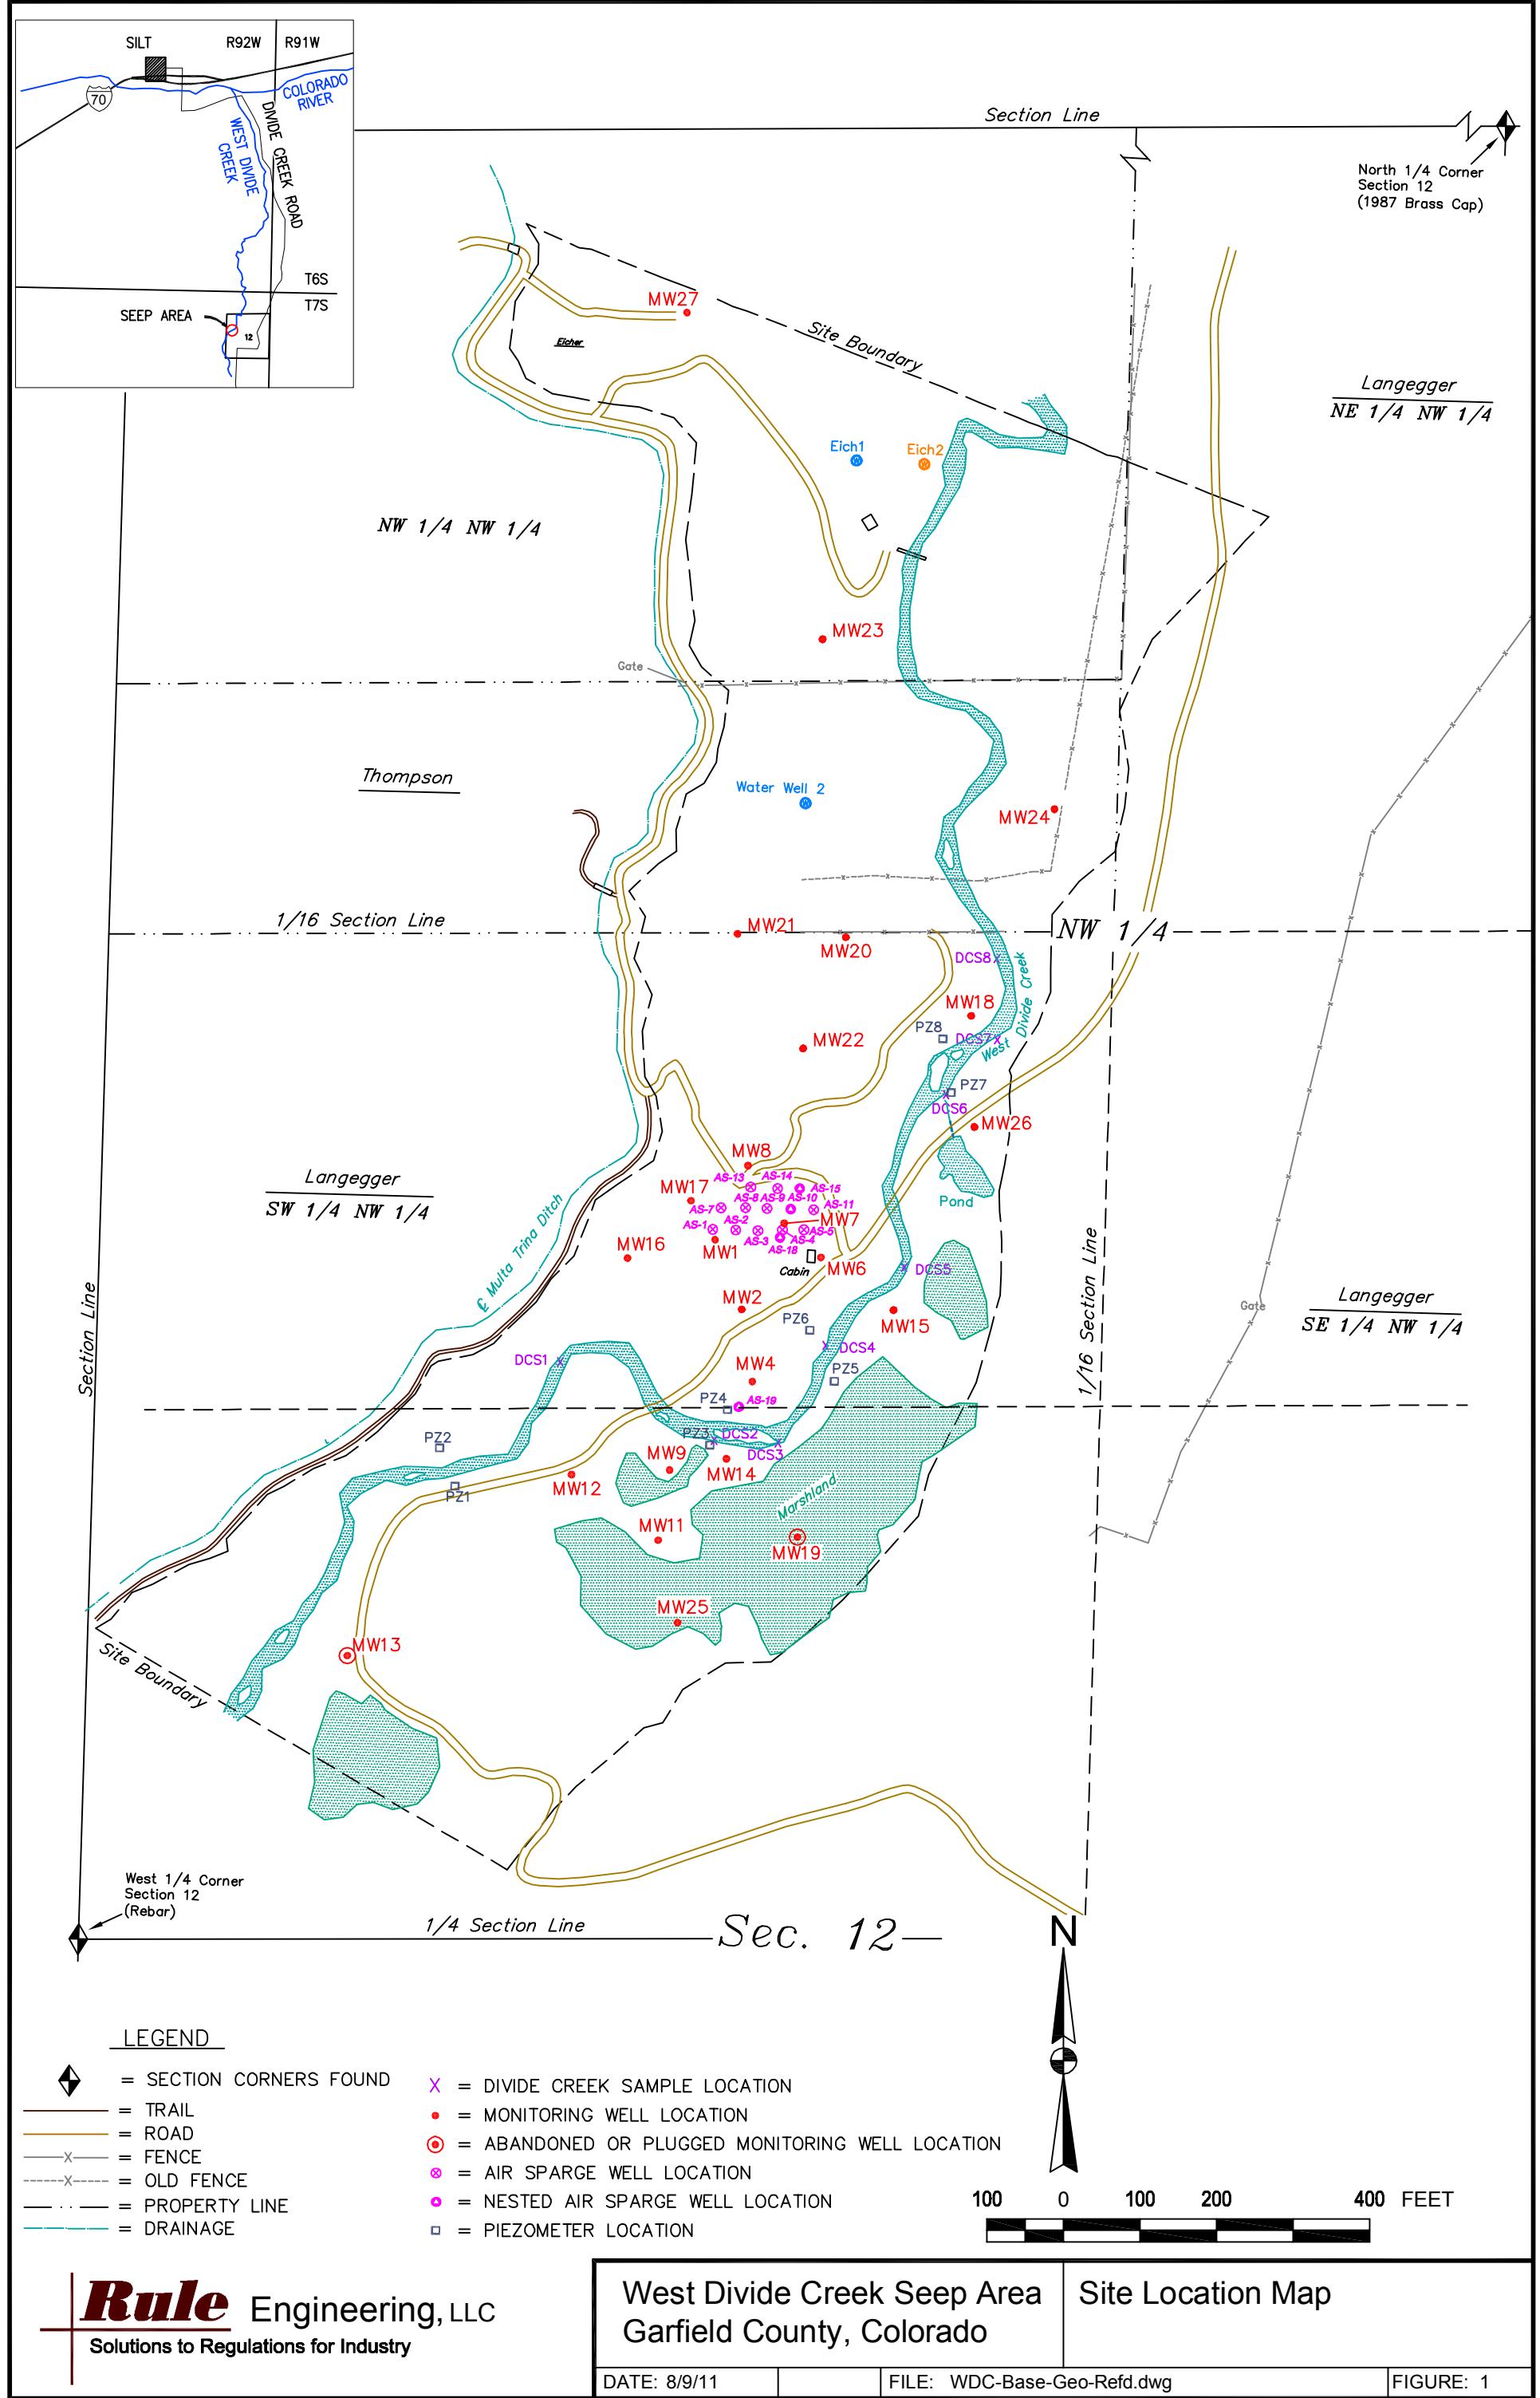

Sincerely,
Rule Engineering, LLC

Notes:

Chemical analysis based on standards accurate to within 2%

Analysis is of gas extracted from water by headspace equilibration. Analysis has been corrected for helium added to create headspace.

These labs had helium added to them: 220759 through 220763

Addition of helium negates the ability to detect native helium or hydrogen.

Additional Remarks:

nd = not detected, na = not analyzed

Table 5. Surface Water Field Parameters

	Temp [°C]	SPC [mS/cm]	DO [mg/L]	pH	ORP [mV]	Water Quality Observations

Attachment A
List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L536293-02	WG555923	SAMP	Chloride	R1866072	J3

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J3	The associated batch QC was outside the established quality control range for precision.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

Methane -----	61.81	-40.36	-177.7	
Ethane -----	7.56	-27.52		
Ethylene -----	0.0002			
Propane -----	2.35	-25.43		
Iso-butane -----	0.332			
N-butane -----	0.329			
Iso-pentane -----	0.0782			
N-pentane -----	0.0400			
Hexanes + -----	0.0393			

Total BTU/cu.ft. dry @ 60deg F & 14.7psia, calculated: 849

Specific gravity, calculated: 0.760

Remarks:

Analysis is of gas extracted from water by headspace equilibration. Analysis has been corrected for helium added to create headspace. Helium dilution factor = 0.55

*Addition of helium negates the ability to detect native helium or hydrogen.

nd = not detected. na = not analyzed. Isotopic composition of carbon is relative to VPDB. Isotopic composition of hydrogen and oxygen are relative to VSMOW. Calculations for BTU and specific gravity per D3588. Chemical compositions are normalized to 100%. Mol. % is approximately equal to vol. %.
