Re: West Divide Creek 2012 Third Quarter Seep Status – Remediation #1815

Dear Mr. Jensen:

Rule Engineering (Rule) prepared this report to present the results of the quarterly monitoring and review of historical data of all groundwater monitoring stations associated with the West Divide Creek Seep for Encana Oil and Gas (USA) Inc. Rule was contracted by Encana to continue monitoring and Operation and Maintenance (O&M) of the existing remediation system at West Divide Creek in July of 2011. This letter report provides a summary of 3rd quarter 2012 sampling results and recommendations for the gas seep associated with Colorado Oil and Gas Conservation Commission (COGCC) Remediation #1815 pursuant to the Schwartz 2-15B well Order No. 1V-276. Figure 1 provides a map of monitoring stations and remediation system locations for this site.

2012 Third Quarter Monitoring

Groundwater

During September 18 and 19, 2012 Rule sampled 23 groundwater monitoring wells as part of the quarterly monitoring program. Monitoring well MW-13 is plugged and abandoned. Monitoring well MW-19 is known to be plugged and will be abandoned if possible in the future (as its location is within a marshy area). Prior to sample collection, static water levels were measured at the wells and piezometers to within 0.01 feet (ft) from the top of the north side of the PVC casing using an electronic water level meter. Piezometer 5 was plugged by sediment therefore DTW was not measured. Prior to collection of the groundwater sample, each well was purged of three casing volumes of water using disposable bailers. Field parameters were obtained during sample collection which included pH, temperature, specific conductance, dissolved oxygen and oxygen reduction potential (ORP) with an YSI® water quality meter. Groundwater field measurement results are provided in Table 1.

A total of three (3) duplicate samples were collected for field and laboratory quality assurance/quality control (QA/QC). Duplicate samples DUP-1-091912, DUP-2-091912 and DUP-3-091912 were collected at monitoring stations MW-4, MW-2, and MW-17, respectively.

All groundwater samples were immediately placed on ice after sample collection and shipped under Chain-of-Custody procedures to Environmental Science Corporation (ESC) for laboratory analysis. Samples were received in good condition within appropriate temperatures by ESC and analyzed for the following parameters:

- Benzene, Toluene, Ethylbenzene, Total Xylene's (BTEX), Method-8260
- Methane, Ethane, Ethene, Method-RSK175
- Chloride, Method-9056

- Sodium, Method-6010B

A summary of the groundwater analytical results is presented in Tables 2 and 3.

In addition to the groundwater chemistry analysis provided by ESC, samples for isotopic analysis of methane were shipped to Isotech Laboratories (Isotech). Based on historical groundwater analytical results of dissolved methane >1.0 mg/L, samples from monitoring wells MW-2, 4, 9, 14, and 17 were analyzed for isotopes of carbon and hydrogen in methane and stable isotopes of carbon in ethane and propane. Samples were received at the laboratory in good condition within appropriate temperatures. A summary of the isotope analytical results is presented in Table 4.

Surface-Water

Rule collected eight (8) surface-water samples on October 19, 2012 at the established monitoring stations. Field parameters were obtained during sample collection which included pH, temperature, specific conductance, dissolved oxygen, and ORP with an YSI® water quality meter. The surface-water field measurements are provided in Table 5. All surface-water samples were immediately placed on ice after sample collection. Samples were received in good condition within appropriate temperatures by ESC and analyzed for the following parameters:

- BTEX, Method-8260
- Methane, Ethane, Ethene, Method-RSK175
- Chloride, Method-9056
- Sodium, Method-6010B

A summary of surface-water analytical results are presented in Tables 6 and 7.

Remediation System

From June 20, 2012 to September 18, 2012, the air sparging system was operational from 0800 hrs to 1200 hrs daily. The following flow rates were recorded for remediation air sparge wells: AS-2 operated at 6.5 standard cubic feet per minute (SCFM), AS-3 at 6.0 SCFM, AS-9 at 5.0 SCFM, AS-10, 11, and 13 each operated at 5.5 SCFM. AS-8 was believed to be malfunctioning with a reading of 10.0 SCFM (pin was pegged). Blower 1 was operating at 67 SCFM.

Results

Site Hydrology

During the 3rd quarter 2012 monitoring period, groundwater elevation varied from surface at MW-25, with an elevation 5968.97 feet above mean sea level (AMSL), to 5934.68 feet at MW-23. Figure 2 illustrates the potentiometric surface for the site during this quarter. An average groundwater gradient was determined to be 0.026 with a groundwater flow to the northeast/north consistent with the drainage system of West Divide Creek within the seep area.

Analytical Results

Groundwater analytical results indicate that monitoring stations MW-2, MW-4, and MW-17 had dissolved benzene concentrations of 0.044 mg/L, 0.045 mg/L and 0.037 mg/L, respectively. Dissolved toluene and ethylbenzene concentrations were below detection levels in all wells. Total dissolved xylenes were detected at MW-2 and MW-4 at concentrations of 0.005 mg/L and

0.01 mg/L, respectively. The detections of total xylenes are below COGCC Table 910-1 groundwater standards. Figure 3 illustrates dissolved BTEX and dissolved methane results for the third quarter 2012.

Figure 4 illustrates the dissolved benzene impacts greater than 0.005 mg/L. Dissolved benzene concentrations above Table 910-1 allowable limits were detected in wells MW-2, MW-4, and MW-17. Monitoring wells 1, 7, and 16 have been “non-detect” for dissolved benzene since 2005, indicating two separate source areas for these wells. Additionally, MW-2 and MW-4 are outside the radius of influence of the remediation system. This separation of the dissolved benzene impacted area illustrates stabilization of the source area with minimal impact from the remediation system.

The highest concentrations of dissolved methane were observed in MW-4 (8.2 mg/L), MW-2 (5.6 mg/L), MW-17 (3.3 mg/L), and MW-9 (3.2 mg/L). Figure 5 illustrates the dissolved methane concentrations above 1 mg/L, with the highest concentrations of dissolved methane observed within the seep area, consistent with historical data. The separation of the dissolved methane plume within the seep area is consistent with the dissolved benzene plume separation. Isotopic analysis indicate dissolved methane samples from MW-2, 4, 9, 14 and 17 plot as thermogenic (Figure 6). The presence of butane and propane in MW-2, 4, 9 and 17 and the presence of pentane are indicators of thermogenic gas.

Figure 7 illustrates dissolved sodium (Na) and chloride (Cl) concentrations in groundwater and surface-water. The highest Na concentration in groundwater was 400 mg/L at MW-27 and the lowest was 35 mg/L at MW-25. The Na concentrations in surface-water ranged from 81 mg/L to 110 mg/L. The highest Cl concentration in groundwater was 53 mg/L at MW-23 and the lowest was 4.8 mg/L at MW-15. The Cl concentrations in surface-water ranged from 14 mg/L to 16 mg/L. Currently there are no primary drinking water standards for chloride or sodium with respect to COGCC or Colorado Department of Public Health and Environment (CDPHE) Water Quality Control Commission Regulation No. 41. CDPHE does have a secondary drinking water standard for chloride of 250 mg/L.

Figure 7 illustrates the seep area has little to no correlation to higher concentrations of sodium or chloride concentrations. The highest concentrations were observed far downgradient of the seep area and can be attributed to natural groundwater geochemistry conditions.

Analytical results for surface water samples indicate no detections of BTEX, and no detections of dissolved methane (Tables 6 and 7).

Discussion of Historical Groundwater Monitoring Results

Since the start of the seep in 2004, Encana has collected 1,368 groundwater samples within the seep area (through daily, weekly, or quarterly sampling). A summary of the historical BTEX and Methane concentrations is provided in the electronic attachment (Appendix B).

Monitoring stations 11, 13, 15, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, Eich1/Eich2, and Lang have not had a detection of BTEX in 99 months. Encana continues to monitor these stations far past a point of compliance. Industry standard for petroleum contaminated sites for clean monitoring stations is 5 quarters. When the analytical results from continued groundwater monitoring show concentrations that are below the COGCC Groundwater Standards in Table 910-1 for 5 or more consecutive quarters, and given the understanding that the plume is not

expanding further, monitoring at these locations should be reviewed. Monitoring using a smaller set of sampling locations downgradient of the source area should be sufficient.

Groundwater monitoring point Eich2 is a lateral extension of well Eich1. Eich1 is the main well and Eich2 has a lateral pipe extending to the east from Eich1 where a spigot is mounted for water usage. So, when Eich1/Eich2 is referenced, it is referring to the same well.

Below is a summary of monitoring stations impacted by the seep, from upgradient to downgradient along the site:

- MW-12: Dissolved benzene concentrations declined dramatically before the system was installed in 2005 (Figure 8) and have remained below the groundwater standard since March 2007. MW-12 is upgradient of the treatment area.
- MW-9: Dissolved benzene concentrations declined dramatically before the system was installed in 2005 (Figure 9) and have remained below the groundwater standard since March 2007. MW-9 is upgradient of the treatment area.
- MW-14: Dissolved benzene concentrations declined dramatically before the system was installed in 2005 (Figure 10) and have remained below the groundwater standard since March 2007. MW-14 was considered to be within the original source area, but is upgradient of the actual treatment area.
- MW-4: Dissolved benzene concentrations remain above the groundwater standard (Figure 11). MW-4 is upgradient of the treatment area, but dissolved benzene concentrations have declined over time.
- MW-2: Dissolved benzene concentrations remain above the groundwater standard (Figure 12). MW-2 is upgradient of the treatment area, but dissolved benzene concentrations have declined over time.
- MW-16: Dissolved benzene concentrations declined dramatically before the system was installed in 2005 (Figure 13) and have remained below the groundwater standard since October 2005. MW-16 is upgradient of the treatment area.
- MW-6: Dissolved benzene concentrations declined dramatically before the system was installed in 2005 (Figure 14) and have remained below the groundwater standard since May 2005.
- MW-1: Dissolved benzene concentrations declined to non-detect levels before the system was installed (Figure 15) and have remained below the groundwater standard since March 2005.
- MW-7: Dissolved benzene concentrations declined to non-detect levels before the system was installed (Figure 16) and have remained below the groundwater standard since April 2005.

- MW-17: Dissolved benzene concentrations declined before the system start up, and continue to decline (Figure 17), but remain above the groundwater standard.
- MW-8: Dissolved benzene concentrations declined to non-detect levels before the system was installed (Figure 18) and have remained below the groundwater standard since July 2005.

Divide Creek Remediation Analysis

As described in previous West Divide Creek Seep Status Reports, the overall decline in dissolved benzene concentrations are attributed to a reduction in the mass flux of hydrocarbons from the seep. The natural processes of dilution, degradation, dispersion, and volatilization under the current site conditions provide remediation through natural attenuation (RNA), resulting in the observed decline in concentrations. Based on the extensive monitoring conducted to date, the groundwater plume is stable and/or diminishing, and demonstrates no potential for migration towards downgradient groundwater receptors (ie. water wells), without immediate detection within the existing monitoring well network.

Historical and current data, including dissolved oxygen monitoring, indicate the treatment system has minimal or no effect on the current source area. The 3rd quarter results reveal the relative percentage difference in the treatment area compared to background (MW-11, Background vs. MW-25, Treatment Area) is 47% decrease.

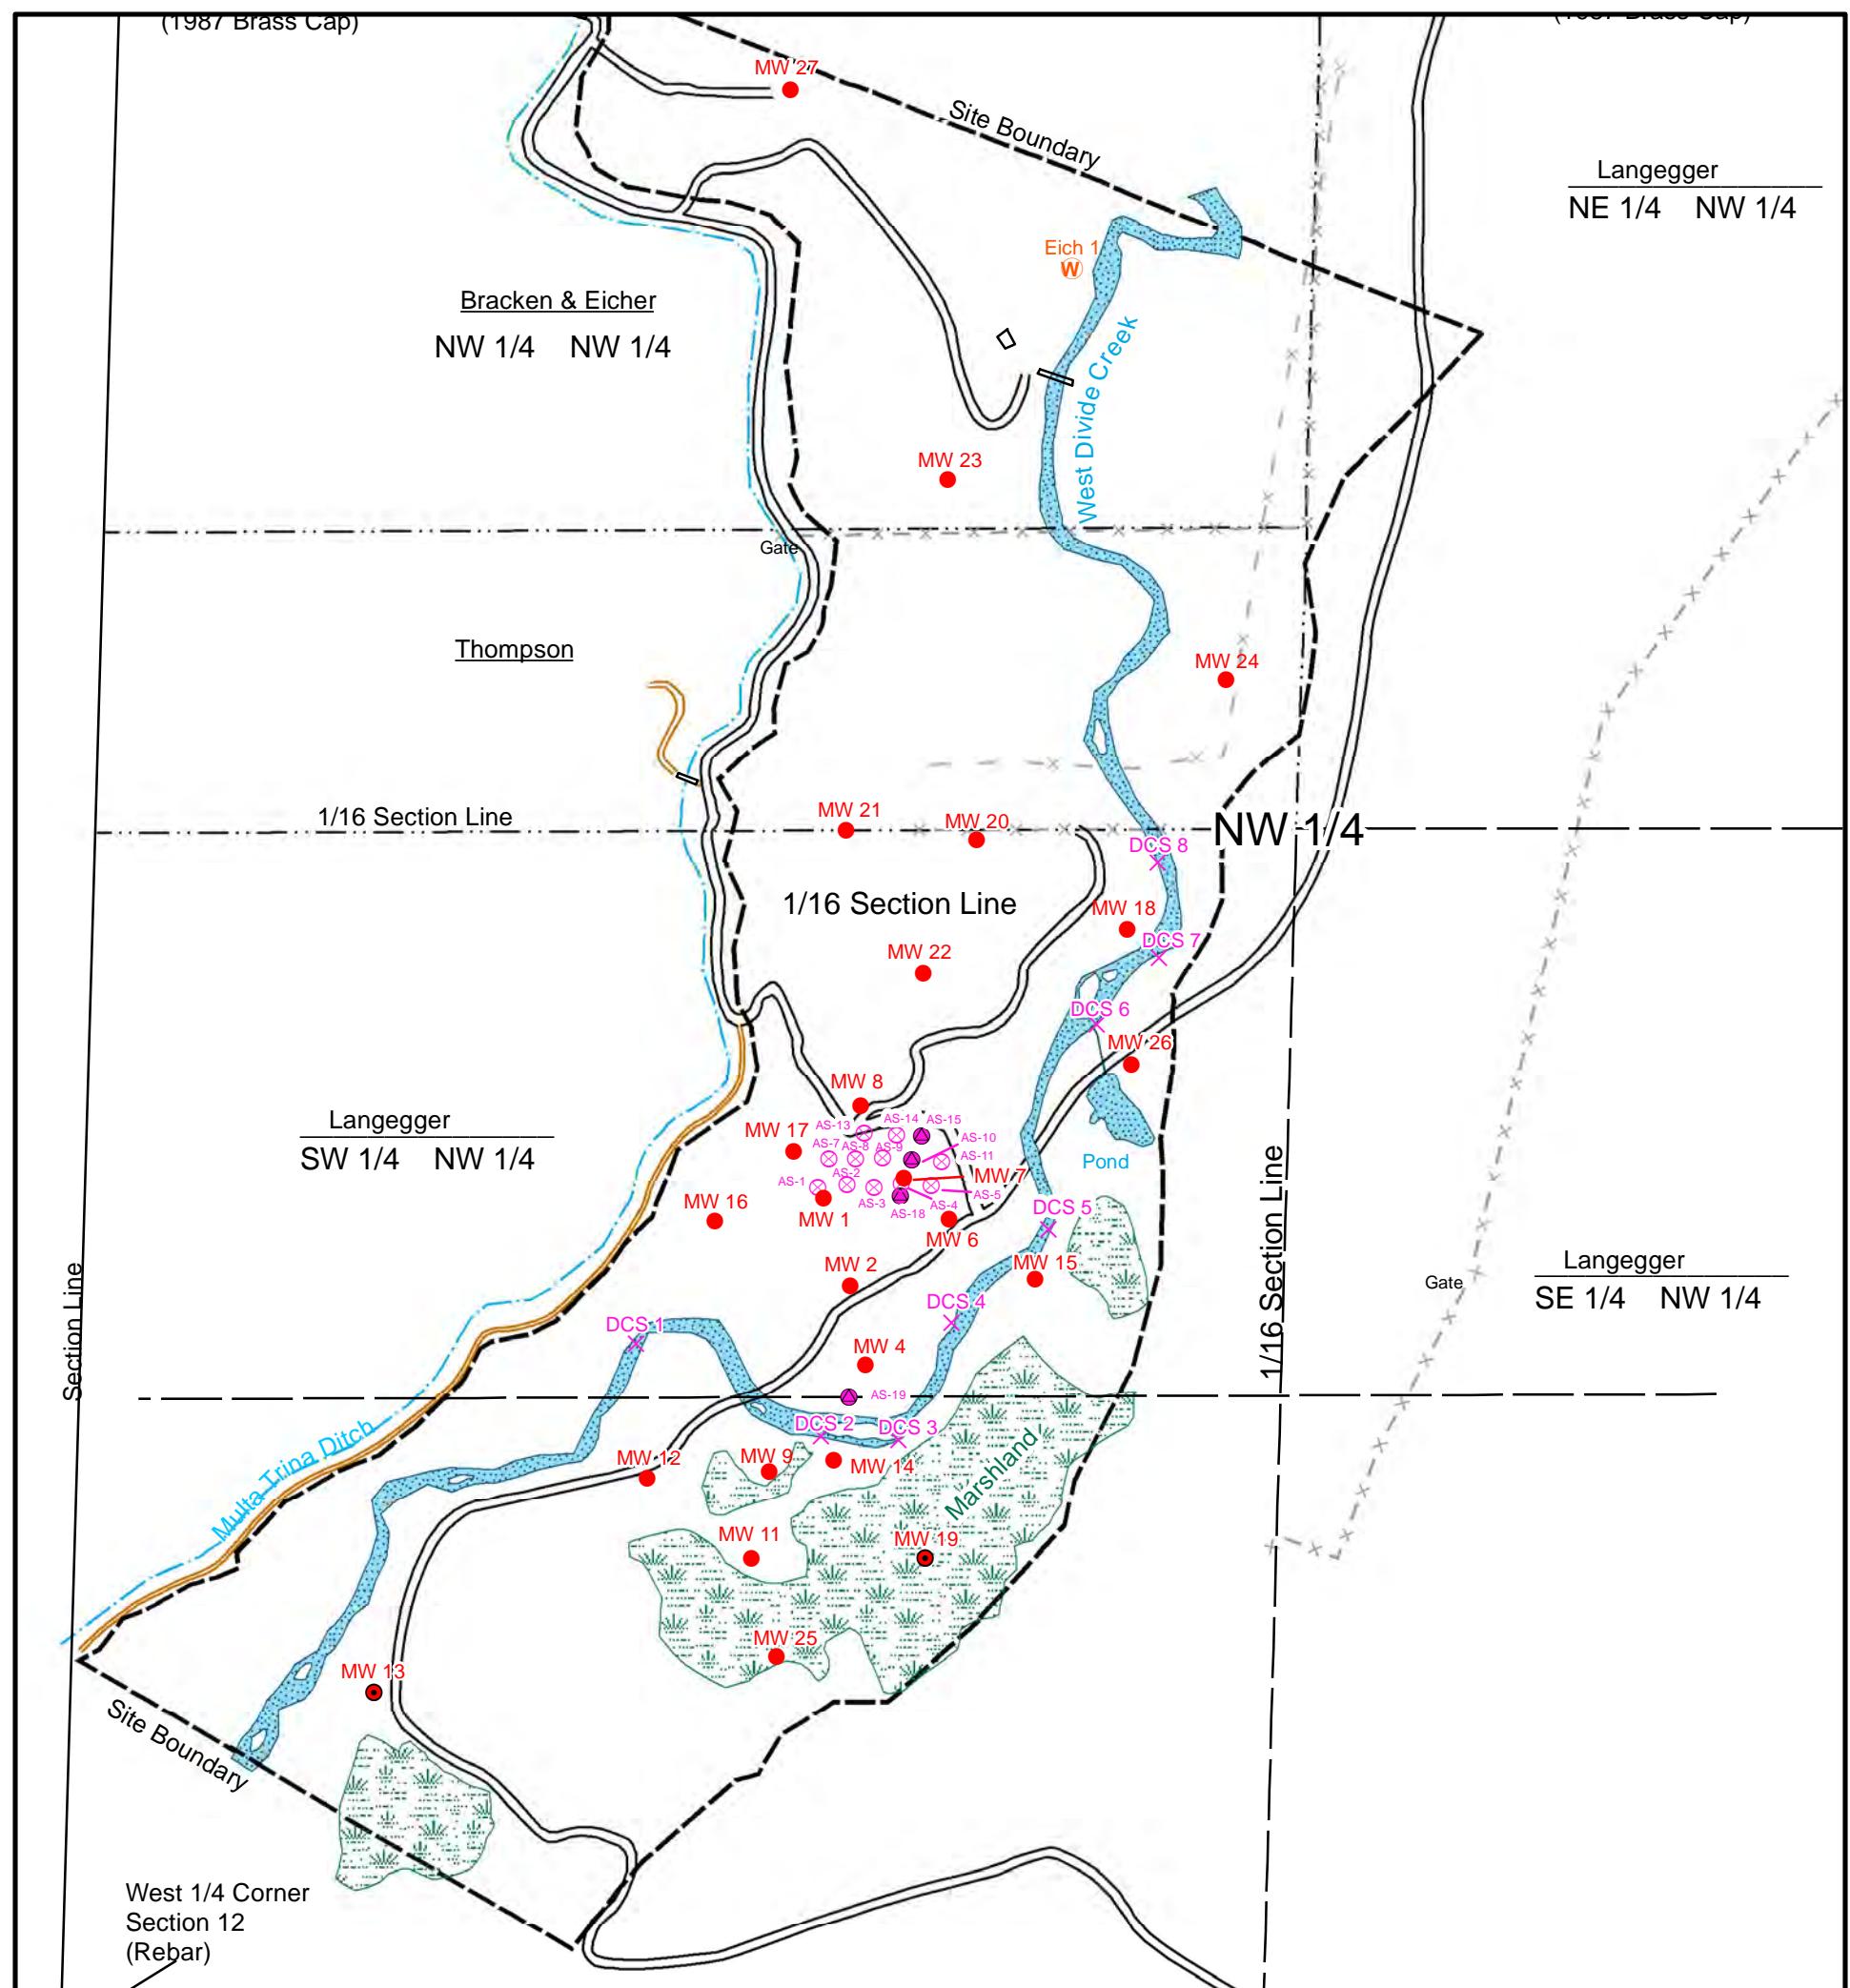

Rule Engineering appreciates the opportunity to provide services to Encana. If you have any questions please contact me at 970-244-8500.

Sincerely,
Rule Engineering, LLC

Notes:

Analysis is of gas extracted from water by headspace equilibration. Analysis has been corrected for helium added to create headspace.

Addition of helium negates the ability to detect native helium and may negate the ability to detect hydrogen.

Additional Remarks: nd = not detected, na = not analyzed

Table 5. September 2012 Surface Water Field Parameters

Report Summary

Friday September 28, 2012

Report Number: L596294

Samples Received: 09/20/12

Client Project: WDC

Description: West Divide Creek - 02E

The analytical results in this report are based upon information supplied by you, the client, and are for your exclusive use. If you have any questions regarding this data package, please do not hesitate to call.

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
B	(EPA) - The indicated compound was found in the associated method blank as well as the laboratory sample.
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Summary of Remarks For Samples Printed
09/28/12 at 09:44:37

TSR Signing Reports: 358
R5 - Desired TAT

Be sure sub lab uses CLIENT SAMPLE ID & not ESC sample ID. Try not to report benzene BDL above 250x dilution. Water samples ONLY under this account. Soils under ENCANACO. Log PAHs as PAHSIM.

Quality Assurance Report
Level II
L596294

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

Quality Assurance Report
Level II
L596223

October 18, 2012

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.
