## 1.0 Introduction

Laramie Energy II, LLC (Laramie Energy II) is developing natural gas resources in the vicinity of Jack's Pocket on the north flank of Battlement Mesa in Garfield County, Colorado. These gas wells were originally drilled by Petrohunter Operating Co. and GSL Energy Corp. and were purchased and completed by Laramie Energy II in 2008. Laramie Energy II retained Cordilleran, a division of Olsson Associates (Olsson Associates) to collect natural gas and produced water sampling for the Furr Wells to comply with the requirements of the Colorado Oil and Gas Conservation Commission (COGCC) Sampling and Analysis Plan (SAP) requirement developed by URS Corporation (URS) for all natural gas wells within a three-mile radius of the former Project Rulison site.

The Laramie II natural gas wells discussed in this report are all located within a 3-mile radius of the Project Rulison underground nuclear test site conducted in September 1969 by the Atomic Energy Commission, a predecessor agency to the Department of Energy (DOE), and Austral Oil, a private oil company. Project Rulison was a subsurface natural gas stimulation nuclear test to produce natural gas from tight gas sands in the Cretaceous age Williams Fork Formation.

In general, the SAP requires all companies drilling or producing natural gas wells within specified zones and sectors surrounding the former Rulison site to review certain drilling data (gamma ray logs) and to sample certain production media (natural gas and produced water) to document the presence or absence of potential impacts associated with Project Rulison. Section 1.2 of this Report provides additional details of the SAP requirements.

All known natural gas wells within the three mile radius of Project Rulison (including Laramie Energy II wells) are shown on Figure 1. Laramie Energy II's Furr Gas wells are shown more specifically on Figure 2.

The drilling and baseline monitoring activities for the Furr wells was conducted in November and December 2008 with the results presented in a report titled Laramie Energy II, LLC Tier II Gas Well Baseline Monitoring and Production Report, Rulison Field, Garfield County, Colorado November - December 2008 issued in May 2009 once all of the laboratory analytical data had been received. The results of this drilling and baseline monitoring indicate that no Project Rulison related radionuclides were detected in any of the gas or produced water samples. Copies of the report, including the December 17, 2008 baseline/production data for the Furr 16-22B and Furr 16-22D wells, were provided to Laramie Energy II, the Colorado Oil and Gas Conservation Commission (COGCC), the Colorado Department of Public Health and

Environment (CDPHE) Hazardous Materials and Waste Management Division -Radiation Management Unit, S.M. Stoller/DOE, the Garfield County Oil and Gas Liaison, and URS Corporation.

The subject of this document is to report the first quarter, 2009 production monitoring results for the Laramie Energy II Furr 16-22D well conducted on April 14, 2009. The Furr 16-22B Tier II gas well was shut-in and could not be sampled on April 14, 2009.

For purposes of classifying the Laramie Energy II wells within the context of the approved SAP, both the Furr 16-22D and Furr 16-22B are considered Tier II wells located respectively in Sectors 10 and 11. The Furr 16-22B is currently considered to be the closest natural gas wells to the former Project Rulison site in sector 11. The Furr 16-22D has a surface location in sector 11 and a bottom hole location in sector 10, but the bottom hole location is very close to the sector dividing line. This well was sampled as a voluntary measure as Noble Energy has wells in sector 10 closer to the former Project Rulison site. Based on this, the Furr 16-22D may be dropped from future quarterly sampling if another well on the same pad location is determined to be more suitable for quarterly monitoring. All of the wells on this well pad were sampled on December 17, 2008 during baseline/production monitoring.

As with the drilling and baseline sampling conducted in November and December of 2008, the first quarter laboratory analytical results for 2009 do not indicate the presence of any Project Rulison related radioactivity. A summary table of Laramie Energy II well locations and sampling activities is presents as Table 1.

### 1.1 Tier II Zone Monitoring Requirements

URS Corporation (URS) is working for Noble Energy, EnCana Oil & Gas (USA), Inc., and Williams Production RMT who are also conducting natural gas well drilling operations in the vicinity of Project Rulison. URS has developed a Rulison Sampling Analysis Plan (SAP), Revision 2 issued in March 2008. The URS Rulison SAP defines Tier II wells as those gas wells located outside the 1-mile radius, but within the 3-mile radius of Project Rulison; whereas Tier I wells are defined as those gas wells located within the 1-mile radius of Project Rulison. This SAP has been adopted by the COGCC, and outlines the required sampling and analysis for all operators within a three-mile radius or Project Rulison.

According to the March 2008 Revision 2 of the URS SAP the Tier II well monitoring includes:

- Drilling Monitoring;
- Production Monitoring; and
- Baseline produced water and natural gas monitoring.

A discussion of these monitoring activities was presented in the May 2009 report. According to the URS Rulison SAP <u>Table 2 - Tier I and II Sampling and</u> <u>Analysis Scheme for Gas Wells within a Three Mile Radius of Project Rulison</u> well production sampling provisions require that Tier II wells be sampled and analyzed as follows:

- A one-time sampling and analysis of produced water for the radiological and non-radiological analytes listed in Table 3 and Table 4 of the Rulison SAP. The Tier II wells are to be sampled as soon as possible after frac-ing but no later than 30-days after the first gas delivery from a new gas well;
- If a Tier II gas well is the closest well in a sector (i.e. no Tier I well), produced water and natural gas will be sampled and analyzed for the radiological analytes listed in Table 3 quarterly during the first year, semi-annually (twice a year) during the second and third year, and annually thereafter; and
- Further testing contingent on verified Project Rulison-related radionuclide detection in Tier I zone wells.

## 1.2 Laramie Energy II Furr 16-22B and Furr 16-22D Gas Wells

Both the Furr 16-22B and Furr 16-22D are directionally drilled wells meaning that the bottom of the well is located several hundred feet or thousands of feet away from the surface location. The Laramie Energy Furr 16-22B well is the closest Tier II well in Sector 11, and as such is required to be sampled quarterly. However, it was shut-in on April 14, 2009, and could not be sampled. The Furr 16-22D has a surface location in sector 11 and a bottom hole location in sector 10. The Furr 16-22D was sampled on April 14, 2009 in lieu of the Furr 16-22B as it is the next closest Tier II well to Project Rulison operated by Laramie Energy II. Noble Energy has Tier I and Tier II wells located in sector 10 that are closer to the dividing line between sector 10 - sector 9 but are closer to the former Project Rulison site than any of the Furr wells.

Olsson Associates conducted the 1<sup>st</sup> quarter 2009 sampling trip for the Furr 16-22D on April 14, 2009. Both of the Furr 16-22D and Furr 16-22B wells were sampled as part of the baseline sampling program on December 17, 2008. The Furr 16-22B was shut-in at that the time of the 1<sup>st</sup> quarter 2009 sampling event and could not be sampled. These wells are reportedly yielding less produced water than during the initial production phase and may not be able to be sampled in the future due to a lack of produced water volume.

This report presents the results from Furr 16-22D gas and produced water samples collected on April 14, 2009. Copies of the Isotech Laboratories Inc. laboratory reports for the Furr 16-22D gas analysis and tritium in produced water from are included as Appendix A. The analytical results for the produced water sample from the Furr 16-22D analyzed by GEL Laboratory LLC are presented as Appendix B.

## 1.3 Tier II Zone Drilling Monitoring Requirements

The drilling monitoring requirements in the SAP consist of a review of the openor cased-hole gamma-ray logs through the Williams Fork Formation interval for evidence of elevated gamma radiation. This review is conducted to determine whether there is potential evidence of Project Rulison-related gamma radiation observed in the formation during gas well drilling. The gamma-ray logs also detect naturally occurring radionuclides such as potassium-40, uranium, and thorium isotopes. According to the URS Rulison SAP, the logs will be reviewed for evidence of above normal gamma-ray signatures. A gamma radiation measurement greater than 500 API gamma units or any other gamma readings that appear to be anomalous are to be noted by the drilling supervisor or his designated representative and immediately reported to the Company management and the [radiation safety officer] RSO for review and guidance.

A review of the well logs for the Furr 16-22B and Furr 16-22D wells on the COGCC website database shows that gamma-ray signatures were typically less than 200 API gamma units. Special attention was paid to the well log intervals below 6,000 feet to the bottom of each the wells. Copies of these logs are presented in Appendix C.

A "spike" was noted at approximately 8,445 feet on the Reservoir Monitor Tool Elite (RMTE) log for the Furr 16-22D well; however, there was no corresponding spike through this interval on the gamma track on the cement bond log for the Furr 16-22D well. This anomaly does not appear to be related to Project Rulison based on the analytical data for the two produced water and natural gas samples collected from this well.

Olsson Associates contacted Halliburton who ran the RMTE log and cement bond log to ask about the anomaly. According to Halliburton, the anomaly appears to be caused by the RMT Tool and not the formation. It occurred very near the total depth [of the Furr 16-22D well], when the neutron generator was turned on for logging which is suspected as the cause of the anomaly. The gamma-ray track on the cement bond log for the same interval did not show anything out of the ordinary, and the cement bond log that was run later. If there had been radioactive material present it would have been recorded on the bond log. The repeat on the bond log also suggests that there is no radioactive material present.

Laramie Energy II re-ran the RMTE logging tool in the Furr 16-22D on June 3, 2009; but could not make it down to the interval and was about 50 feet short.

### 1.4 Application for Permit to Drill and Conditions of Approval

The COGCC may attach Conditions of Approval (COA) to the Application for Permit to Drill (APD) that parallel or are additional to what is contained in the URS SAP for Tier II wells. According to the copies of the APDs for the Furr 16-22B and Furr 16-22D wells found on the COGCC's internet website database, the additional COA requirements are as follows:

`To prevent the loss of drilling fluid to shallow formations and to protect shallow groundwater and surface waters, conductor pipe shall be set at a depth sufficient to insure absolute wellbore integrity during the drilling operations. Conductor pipe must be set at a minimum depth of 200', or at a depth at which formation integrity is sufficient to prevent a loss of drilling fluid, whichever is greater, on the first well on each pad and cemented by the pumped plug method. Conductor pipe setting depths on subsequent wells on the pad may be increased or decreased based on geologic conditions encountered in the first well so as to insure absolute wellbore integrity.'

*'Submit a radionucleide (sic) monitoring program via Sundry Notice Form 4 for this well and obtain approval of the plan prior to spudding the well.'* 

The Furr 16-22B and Furr 16-22D wells were sold by GSL Energy Corporation to Petrohunter Operating Company in late 2006 and sold in turn to Laramie Energy II in 2008. As with other operators in the Rulison area, Laramie Energy II follows the URS developed Rulison SAP, Revision 2, March 2008 as the radionuclide monitoring program for the area. This SAP has been accepted by the COGCC, CDPHE, DOE and Garfield County.

### 1.5 Data Verification and Validation

Olsson retained Diane Short & Associates of Lakewood, Colorado to perform the independent data validation on the November and December 2008 radiochemistry and non-radiochemistry baseline and production data, and also on the radiochemistry parameters for the first quarter 2009 production data for the Furr 16-22D well.

The data validation will be provided as an addendum to the <u>Laramie Energy II,</u> <u>L.L.C. Tier II Gas Well Baseline Monitoring and Production Monitoring Report,</u> <u>Rulison Field, Garfield County, Colorado November - December 2008</u> which was submitted to the COGCC, Colorado, CDPHE-HMWMD Radiation Control, S.M. Stoller/DOE, Garfield County, and URS Corp. in May 2009.

## 2.0 Natural Gas and Produced Water Sampling

Laramie Energy II authorized sampling of the Furr 16-22D and Furr 16-22B wells, are both Tier II wells located in sectors 10. The Furr 16-22B has a bottom of hole location that is also located in sector 10; however, it was shut-in and could not be sampled. The Furr 16-22D has a surface location in sector 10 and a bottom of hole location in sector 11. Olsson performed the sampling of the natural gas and produced water by following the URS Rulison SAP, Revision 2, March 2008. There are no Tier I wells within Sector 10; therefore, the Furr 16-22B is the closest Tier II well in this sector. The Furr 16-22D is the next closest Tier II well to Project Rulison operated by Laramie Energy II. Noble Energy has completed Tier II wells and Tier I wells in Sector 10 that are closer to Project Rulison that any of the Laramie Energy II wells. However, these Noble Energy wells are located near the dividing line between sectors 9 and 10.

### 2.1 Quarterly Production Sampling - Tier II Furr 16-22D Gas Well

Well Identification:	Well Surface Location:
<ul> <li>Furr 16-22B</li> </ul>	SE ¼, SE ¼, Section 22, T7S, R95W; and

• Furr 16-22D SE <sup>1</sup>/<sub>4</sub>, SE <sup>1</sup>/<sub>4</sub>, Section 22, T7S, R95W.

Olsson Associates personnel sampled natural gas and produced water the Furr 16-22D well on April 14, 2009 for the radiochemistry parameters listed in Table 3 of the URS Rulison SAP. The samples consisted of natural gas and produced water collected from the Furr 16-22D well separator with the assistance of Laramie Energy II's pumper. Olsson Associates collected the gas sample using a two-stage regulator and obtaining the gas from the separator. Olsson Associates collected the produced water samples from the dump line on the separator. Since there are multiple wells on these pads and production fluids are co-mingled in the onsite tank batteries, it is not possible to collect representative produced water samples for individual wells from the onsite production tanks as described in the URS Rulison SAP sampling protocols.

## 2.2 Natural Gas Sample Analysis

A natural gas sample was collected from the Furr 16-22D on April 14, 2009 and was submitted to Isotech in Champaign, Illinois for gas compositional analysis including carbon-14 (<sup>14</sup>C) and tritium (<sup>3</sup>H), a radioactive form of hydrogen. The natural gas sample was collected in an evacuated, propane tank provided by Isotech, using a two-stage pressure regulator connected to the separator or the natural gas wellhead.

Isotech reported the <sup>3</sup>H in tritium units (TU). One TU is equivalent to 3.19 picocuries per liter (pCi/L); therefore, any tritium present in the gas would be less than 32 pCi/L. The tritium analysis measures counts above background, and if the concentration is high enough the laboratory can report a finite value with a calculated uncertainty. If the concentration is low relative to the standard deviation of the measurement then the values are reported as "less than" the laboratory reporting limit, meaning that tritium was not detected. Isotech's reporting limit for tritium ranges from 10 TU to 15 TU.

Beginning in about 1954, atmospheric tritium levels rose in excess of 1,000 TU due to nuclear weapons testing, and have declined back to natural background levels since then as a result of the ban on nuclear testing. Current natural background levels for tritium in the atmosphere range from 5 TU to 50 TU (15.9 pCi/L to 159.5 pCi/L). The isotopic composition of hydrogen is compared relative to the Vienna Standard Mean Ocean Water (VSMOW) standard.

Isotopic composition of carbon is relative to the Vienna Peedee Belemnite (VPDB)  $\delta^{13}$  Standard and is based on the carbon isotopes in the shell of a marine fossil. The laboratory detection limit is 1 percent modern carbon (pMC). The result indicates that carbon-14 is not present in the natural gas and the natural gas has been isolated from sources of modern carbon.

Krypton-85 (<sup>85</sup>Kr) was the only other radionuclide that was identified in the Project Rulison estimated inventory potentially present in the natural gas. Isotech is not able to analyze the gas samples for the presence of <sup>85</sup>Kr. Krypton-85 (<sup>85</sup>Kr) disintegrates by beta decay to form stable rubidium-85 (<sup>85</sup>Rb). Analysis of <sup>85</sup>Kr beta decay activity in groundwater is restricted to a limited number of research laboratories worldwide due to complications in sampling which require large sample volumes, long counting times, and specialized analytical methods (Clark and Fritz, 1997) (Gholam, Lehr, and Perrochet, 2006).

### 2.3 Produced Water Sample Analysis

A produced water sample was collected from the dump line on the Furr 16-22D separator unit located on the well pad and was submitted for analysis of radiochemistry parameters as listed in Table 3, as specified for Tier II wells in Table 2 of the URS Rulison SAP. The produced water sample collected on April 14, 2009 was submitted to Isotech for tritium analysis and to GEL Laboratory in Charleston, South Carolina for radiochemistry analysis (gamma spectroscopy, gas flow proportional counting for gross alpha and gross beta, chlorine-36 (<sup>36</sup>CI), strontium-90 (<sup>90</sup>Sr), liquid scintillation analysis for Technetium-99 (<sup>99</sup>Tc), and total

uranium). The laboratory analytical results are discussed in the following section and the results are summarized in Table 1 through Table 4.

According to the USGS Open File Report Geohydrology - Project Rulison (Voegeli, West, Cordes, 1970), intervals below 6,000 feet bgs in the R-EX hole were analyzed in 1968 for the presence of gross alpha as Uranium equivalent and gross beta, as  ${}^{90}$ Sr- ${}^{90}$ Y. The alpha activities ranged from < 0.4 µg/L to 9.8 µg/L, and gross beta activities ranged from 29 pCi/L to 70 pCi/L (Voegeli, 1969).

## 3.0 Laboratory Analytical Results

The following sections present the laboratory analytical results for natural gas samples and produced water samples. Radionuclide results are presented first followed by the results for inorganic and organic analyses. The laboratory analytical results for the natural gas and produced water sample show that there are no Project Rulison related radionuclides present in the natural gas or produced water collected from the Furr 16-22D Tier II gas well.

## 3.1 Natural Gas Sample Results

The natural gas sample results are presented in Table 1 and copies of the Isotech laboratory gas sample reports are presented in Appendix A. The Isotech laboratory reports present the compositional analysis reported in mol percent for components in each of the gas samples. The results show that the samples are predominantly composed of methane with lesser concentrations of helium, hydrogen, oxygen, carbon dioxide, nitrogen, ethane, propane, iso-butane, N-butane, iso-pentane, and hexanes. Argon, carbon monoxide, hydrogen sulfide, and ethylene gas were not detected. The gas samples were also analyzed for the radionuclides tritium (<sup>3</sup>H) and carbon-14 (<sup>14</sup>C).

## 3.1.1 Tritium Resuts

The tritium  $({}^{3}H)$  in the gas sample was reported as < 10 TU, and was not detected above the laboratory method detection limit.

## 3.1.2 Carbon-14 Results

The carbon-14 result was reported for the gas sample from the Furr 16-22D as  $0.5 \pm 0.1$  percent modern carbon (pMC). The method detection limit is 1 pMC, so the <sup>14</sup>C pMC is less than the detection limit which indicates that the gas sample has been isolated from sources of modern carbon.

## 3.2 Produced Water Sample - Radiochemistry Results

The following sections present the laboratory analytical results for the produced water sample collected from the Furr 16-22D gas well on April 14, 2009. Copies of the laboratory report from Isotech and GEL are included as Appendix B and Appendix C.

## 3.2.1 Tritium Results

The laboratory result for tritium  $({}^{3}H)$  in produced water reported by Isotech was less than ten (< 10.0 TU) or less than 32 pCi/L. The minimum detectable

concentration (MDC) that Isotech is able to achieve for <sup>3</sup>H using this method is 10.0 TU. The tritium results in produced water are summarized in Table 2.

For comparison Olsson converted TU to pCi/L by multiplying by 3.19 and the resulting range of tritium results were from less than 31.9 pCi/L. Natural background tritium levels in precipitation typically range from 10 TU to 20 TU (32 pCi/L to 64 pCi/L). The CDPHE basic groundwater quality standard for tritium is 20,000 pCi/L referenced as the level of activity that could potentially result in an annual dose of 4 millirems of beta radiation.

### 3.2.2 Gross Alpha Radiation Results

The laboratory results for gross alpha activities show that alpha radiation was detected in the Furr 16-22D produced water sample with an alpha activity of 33.0  $\pm$  16.3 pCi/L. The laboratory detection limit (DL) was 21.8 pCi/L and the laboratory reporting limit (RL) was 5.00 pCi/L.

The detected gross alpha activity is due to high total dissolved solids (TDS) concentrations present in the sample. The alpha activity is within the expected range of natural background radiation for the area and is likely due to the presence of naturally occurring uranium, thorium, and their daughter products present in the produced water from the producing formation. One part per million (ppm) uranium (<sup>238</sup>U) equals 0.33 picocuries per gram (pCi/g); and one ppm thorium (<sup>232</sup>Th) equals 0.11 pCi/g.

The results for the gross alpha activities in the produced water sample are summarized on Table 3 and copies of the laboratory report are presented in Appendix B.

## 3.2.3 Gross Beta Radiation Results

The laboratory results for gross beta activities in produced water samples indicated that gross beta activities were detected in the Furr 16-22D sample with a beta activity of 79.4  $\pm$  23.0 pCi/L. The laboratory DL was 34.8 pCi/L and the RL was 5.00 pCi/L.

The gross beta results are within the expected range of natural background radiation for the area and are likely due to the presence of naturally occurring potassium-40 (<sup>40</sup>K). Potassium-40 (<sup>40</sup>K) was not detected in the April 14, 2009 Furr 16-22D produced water sample submitted for gamma spectroscopy, but it was detected in the December 2008 Furr 16-22D sample.

The results for the gross beta activities are summarized on Table 3 and copies of the laboratory reports are presented in Appendix B for the April 2009 sample.

### 3.2.4 Strontium-90 and Technetium-99 Results

The produced water sample was submitted to GEL Laboratories and was analyzed for Strontium-90 (<sup>90</sup>Sr) and Technetium-99 (<sup>99</sup>Tc). The laboratory results show that Strontium-90 (<sup>90</sup>Sr) and Technetium-99 (<sup>99</sup>Tc) were not detected. The results for the <sup>90</sup>Sr and <sup>99</sup>Tc activities are summarized on Table 3 and copies of the laboratory reports are presented in Appendix B.

### 3.2.5 Chlorine-36 results

Chlorine-36 (<sup>36</sup>Cl) analysis was submitted to GEL for <sup>36</sup>Cl analysis and the results show that <sup>36</sup>Cl activities were not detected above the laboratory reporting limits. The results for the <sup>36</sup>Cl activities are summarized on Table 3 and copies of the laboratory reports are presented in Appendix B.

According to the January 2005 DOE Rulison Site End State Vision document, the estimated inventory of <sup>36</sup>Cl is 2.82 curies (Ci), and according to the URS 3<sup>rd</sup> Quarter 2008 Report, <sup>36</sup>Cl is a less common radionuclide in the inventory at Project Rulison.

## 3.2.6 Gamma-Emitting Radionuclide Results

The majority of the results for the gamma-emitting radionuclides show that activities were not detected above laboratory reporting limits. This is indicated with a letter 'U' in the results and also in the first row of Table 4. The laboratory results for gamma-emitting radionuclides in the Furr 16-22D produced water sample show that Bismuth-214 and Lead-214 results were qualified as 'UI' Gamma Spectroscopy - 'Uncertain Identification.' Both <sup>214</sup>Bi and <sup>214</sup>Pb are daughter products of the naturally occurring uranium-238 (<sup>238</sup>U) decay series. Lead-212 (<sup>212</sup>Pb) was also reported in the Furr 15-22B produced water sample, and <sup>212</sup>Pb is a daughter product of the naturally occurring thorium-232 (<sup>232</sup>Th) decay series. Copies of the laboratory reports for gamma spectroscopy results are included in Appendix B.

Potassium-40 (<sup>40</sup>K) was previously detected in seven of the fourteen produced water samples, submitted in November and December 2008 including the sample from the Furr 16-22D. Potassium-40 is one of the most common radionuclides in nature and is frequently found in sedimentary rocks high in clay minerals which contain potassium in their chemical formulas. Potassium-40 was not detected in the Furr 16-22D produced water sample collected in April 2009; however, the gross beta results for this sample indicated beta activity was detected. Krypton-85 (<sup>85</sup>Kr) was also not detected in the produced water sample collected in the Furr 16-22D well analyzed by gamma spectroscopy analysis.

## 4.0 Summary

The Furr 16-22B and Furr 16-22D gas wells are both located in Section 22, Township 7S, Range 95 West of the Sixth Principal Meridian. The Furr 16-22B and Furr 16-22D are Tier II wells in URS Sectors 10 and 11 and are located within the 3-mile radius of Project Rulison as shown on Figure 1 and Figure 2.

Olsson Associates reviewed the gamma-ray well logs for Laramie Energy II's Furr 16-22B and Furr 16-22D. An anomaly was noted in the Furr 16-22D Halliburton RMTE well log at an approximate depth of 8,445 feet. According to Halliburton personnel, the anomaly was most likely caused by the RMT tool, and was not due to radioactivity in the formation. Since it occurred near the total depth of the well where the neutron generator was turned on for logging, Halliburton suspects that this was the cause of the anomaly. No anomalies were observed in the cement bond log for this interval in the Furr 16-22D well which was run after the RMTE log. No anomalies were observed in the Furr 16-22B well logs.

Two Tier I wells owned by Noble Energy are shown within Sector 11 on the COGCC online GIS database. However, these wells were never drilled and the locations were subsequently abandoned, making the Furr 16-22B the closest Tier II well in Sector 11. On April 14, 2009, The Furr 16-22B was shut-in and could not be sampled. The Furr 16-22D surface location is in sector 11, but the bottom hole location is in sector 10. The Furr 16-22D is the next closest Tier II well to Project Rulison operated by Laramie Energy II. Noble Energy has Tier I and Tier II wells located in sector 10 that are closer to Project Rulison than any of the Furr wells. However, these Noble Energy wells are located closer to the dividing line between sector 10 and sector 9 as shown on Figure 1.

Olsson Associates conducted quarterly production sampling of the Furr 16-22D well on April 14, 2009. The Furr 16-22B and 16-22D wells were previously sampled for baseline radiochemistry and non-radiochemistry parameters on December 17, 2008 once they were brought into production. These wells are scheduled to be sampled again in June 2009.

The laboratory analytical results for the natural gas and produced water sample show that there are no Project Rulison related radionuclides present in the natural gas or produced water collected from the Furr 16-22D Tier II gas well. The analytical results for samples collected from the Furr 16-22D well in April 2009 and December 2008 are presented in the attached tables.

The analytical results show that tritium (<sup>3</sup>H), reportedly the most abundant and most mobile radionuclide in the Project Rulison estimated inventory, was not detected in the gas sample or in produced water sample analyzed by Isotech in Champaign, Illinois. Krypton-85 (<sup>85</sup>Kr) is a Project Rulison radionuclide potentially present in the gas; however, Isotech is not able to analyze for <sup>85</sup>Kr. The GEL laboratory results indicate that <sup>85</sup>Kr was not detected in the produced water sample analyzed by GEL for gamma-emitting radionuclides.

Carbon-14 (<sup>14</sup>C) was also identified in the Project Rulison estimated inventory as a radionuclide that potentially could be present in natural gas. The Isotech analytical results for the natural gas sample collected from the Furr 16-22D well show that <sup>14</sup>C was reported at  $0.5 \pm 0.1$  pMC. The laboratory detection limit for this method is 1.0 pMC which shows the sample has been isolated from modern carbon sources.

Naturally occurring radionuclides, such as Bismuth-214 and Lead-214 were reported as uncertain identification in the Furr 16-22D produced water sample. Other gamma emitting radionuclides were reportedly not detected. Laboratory analytical results for gross alpha and gross beta indicate that alpha activities and beta activities were within the range of natural background and these low level activities are most likely due to naturally occurring radionuclides such as <sup>214</sup>Bi and <sup>214</sup>Pb. Gross alpha activities in the produced water are likely to due to high TDS detected in the baseline samples. The gross beta activities may be related to naturally occurring <sup>40</sup>K. The laboratory analytical results indicate that, <sup>36</sup>Cl, <sup>90</sup>Sr, <sup>99</sup>Tc, and total Uranium results were reported as 'not detected' in the Furr 16-22D sample.

B - Baseline Data Collection Date

QP - Quarterly Production Data Collection Date.

N/A - Not Applicable (See explanation below)

NS - Not Sampled. The Furr 16-22B was shut-in and could not be sampled.

According to the URS Rulison SAP, Revision 2, March 2008, Table 2 - *Tier I and Tier II Sampling and Analysis Scheme for Gas Wells within a Three-Mile Radius of Project Rulison*, Tier II Zone wells require a One-Time sampling and analysis (Baseline) for the radiological and non-radiological analytes in SAP Tables 3 and 4 and natural gas for the radiological analytes listed in SAP Table 3 as soon as possible after fracing but no later than 30 days after first gas delivery form a new gas well. If a Tier II well is the closest well in a sector (i.e., no Tier I well), produced water and natural gas will be sampled and analyzed for the radiological analytes listed in Table 3 quarterly during Year 1, semiannually during Years 2 and 3, and annually thereafter.

The Furr 16-22B and Furr 16-22D are the two Tier II wells closest to Project Rulison in Sector 11, and there are no Tier I wells in this sector.

Table presents 1st Quarter 2009 laboratory analytical results for the Furr 16-22D well (04/14/09) and also the baseline results obtained for the Furr 16-22B and Furr 16-22D (12/17/08)

The Furr 16-22B well was shut-in and was not sampled.

Tritium (<sup>3</sup>H) Detection Limit 10.0 TU. Isotopic composition of hydrogen is relative to Vienna Standard Mean Ocean Water (VSMOW).

#### Abbreviations:

ISO - Isotech Laboratories, Inc. of Champaign, Illinois

TU - Tritium Units (One TU is equivalent to 3.19 pCi/L of water) Note: Isotech reported the tritium results in TU and Cordilleran converted to equivalent picocuries per liter.

pCi/L - picocuries per liter

TPU - total propogated uncertainty

< - Result is less than the method detection limit

The TPU is 2s or two standard deviations

NR - Not Reported (Laboratory did not report parameter in this manner)

Table presents 1st Quarter 2009 laboratory analytical results for the Furr 16-22D well (04/14/09) and also the baseline results obtained for the Furr 16-22B and Furr 16-22D (12/17/08) The Furr 16-22B well was shut-in and was not sampled.

Samples were all analyzed by GEL Laboratories, LLC in Charleston, SC

Four Rows:

1) Qualifier	The laboratory data qualifers are designated by one or two letters to provide information about the reported results.
2) Result	Results are the level of activity reported for the individual produced water sample.

A MDC
 A

If the result is less than the reporting limits the radionuclide is reported as 'not detected' (U).

The qualifiers used in the laboratory reports are listed below: U - Result is less than the sample specific Minimum Detectable Concentration (MDC) or Minimum Detectable Activity (MDA), Method Detection Limit (MDL), Limits of Detection (LOD), total propogated uncertainty (TPU), or laboratory reporting limit (RL). UI - Gamma Spectroscopy Uncertain Identification

Note: Values shown in blue represent a detection. The gamma emitting radionuclides that were detected are naturally occurring potassium-40 (<sup>40</sup>K), lead-212 (<sup>212</sup>Pb), lead-214 (<sup>214</sup>Pb), and bismuth-214 (<sup>214</sup>Bi) in a few of the samples.

Re: Cordilleran Compliance Services, Inc Work Order: 228075

Dear Mr. Hix:

GEL Laboratories, LLC (GEL) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on April 16, 2009. This original data report has been prepared and reviewed in accordance with GEL's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at (843) 556-8171, ext. 4297.

Sincerely,

Cheryl Jones signing for Amanda Rasco Project Manager

James,

The gallon container for Sample FURR 16-22D was received at a pH=5. Please confirm it is acceptable for us to preserve this sample prior to analysis. Let me know if you have any questions.

Thanks, Amanda

### Certificate of Analysis Report for

### CORD001 Cordilleron Compliance Services, Inc

Client SDG: 228075 GEL Work Order: 228075

#### The Qualifiers in this report are defined as follows:

- \* A quality control analyte recovery is outside of specified acceptance criteria
- \*\* Analyte is a surrogate compound
- U Analyte was analyzed for, but not detected above the MDL, MDA, or LOD.
- UI Gamma Spectroscopy--Uncertain identification

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the Certificate of Analysis.

The designation ND, if present, appears in the result column when the analyte concentration is not detected above the detection limit.

This data report has been prepared and reviewed in accordance with GEL Laboratories LLC standard operating procedures. Please direct any questions to your Project Manager, Amanda Rasco.

Notes:

The Qualifiers in this report are defined as follows:

\*\* Analyte is a surrogate compound

2040 Savage Road Charleston, SC 29407 - (843) 556-8171 - www.gel.com

### **QC Summary**

Workor	der 228	075				•				-			
	ucr. 220	075								Page 1	10 of 10		
Parmnai	me		NOM	Sample	Qual	QC	Units	RPD%	REC%	Range	Anlst	Date	Time
<	Result is les	ss than value reported	d										
>	Result is gr	eater than value repo	orted										
А	The TIC is	a suspected aldol-co	ndensation proc	luct									
В	For Genera	l Chemistry and Org	anic analysis th	e target analy	te was de	etected in the	associated	l blank.					
BD	Results are	either below the MD	C or tracer reco	overy is low									
С	Analyte has	been confirmed by	GC/MS analysi	s									
D	Results are	reported from a dilu	ted aliquot of th	e sample									
F	Estimated V	/alue											
Н	Analytical l	nolding time was exc	eeded										
J	Value is est	imated											
М	M if above	MDC and less than l	LLD										
М	Matrix Rela	ated Failure											
N/A	RPD or %F	ecovery limits do no	ot apply.										
ND	Analyte con	ncentration is not det	ected above the	detection lin	nit								
NJ	Consult Ca	se Narrative, Data Su	ımmary packag	e, or Project l	Manager	concerning t	his qualifi	er					
R	Sample rest	ults are rejected											
U	Analyte wa	s analyzed for, but n	ot detected abov	ve the MDL,	MDA, or	LOD.							
UI	Gamma Sp	ectroscopyUncertai	n identification										
Х	Consult Ca	se Narrative, Data Su	ımmary packag	e, or Project l	Manager	concerning t	his qualifi	er					
Y	QC Sample	s were not spiked wi	th this compou	nd									
^	RPD of san	ple and duplicate ev	aluated using +	/-RL. Conce	ntrations	are <5X the	RL. Qual	ifier Not Ap	plicable for	Radiochem	istry.		

h Preparation or preservation holding time was exceeded

N/A indicates that spike recovery limits do not apply when sample concentration exceeds spike conc. by a factor of 4 or more.

^ The Relative Percent Difference (RPD) obtained from the sample duplicate (DUP) is evaluated against the acceptance criteria when the sample is greater than five times (5X) the contract required detection limit (RL). In cases where either the sample or duplicate value is less than 5X the RL, a control limit of +/- the RL is used to evaluate the DUP result.

\* Indicates that a Quality Control parameter was not within specifications.

For PS, PSD, and SDILT results, the values listed are the measured amounts, not final concentrations.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the QC Summary.
